Environment Health Chair Selected to Assist With Study

Shuk-mei Ho, PhD, professor and chair of environmental health, was one of 13 researchers selected nationally to help review key scientific literature exploring the relationship between environmental factors and female reproductive disorders. Ho will work with principal investigators Louis Guillette Jr., PhD, of the University of Florida, and Linda Giudice, MD, PhD, of the University of California, San Francisco. The 15-member study team will partner with the Collaborative on Health and the Environment, a non-profit research organization, to assess the research and develop a companion guide that will translate the science for lay audiences, including policymakers, women's reproductive health leaders and other key constituents.
